

FORBES MARSHALL

Level Gauges — Requirement & Selection Sheet

Covers the full visual liquid-level indicator range (FMLG family): direct glass-tube, magnetic bypass, reflex/transparent, and direct weld-on construction.

What's inside

- Level Gauge

How to use this document

- Find the sub-section for what the customer is asking for.
- Hand the requirement questions to the customer, or fill them in together — no product knowledge is needed, only knowledge of the application.
- Leave any answer blank if the customer isn't sure yet; a partial answer still narrows the shortlist.
- Take the answers to the FM Product Finder tool (standalone HTML file), choose the matching family, enter the values, and read off the ranked shortlist with the reasons each model qualifies.
- For full specifications and ordering codes, refer to the product catalogue once a model is shortlisted.

Level Gauge

Visual liquid-level indicators — direct glass-tube, magnetic bypass, reflex/transparent, or direct weld-on — across the FMLG range.

Requirement questions

Ask the customer this	Their answer (write it in)
Is visual indication enough, or is an electrical signal (switch or 4-20 mA) also needed?	
Should it mount on the side or the top of the vessel?	
What is the centre-to-centre distance between the vessel connections?	
What is the vessel's operating and maximum pressure?	
What is the normal and maximum liquid temperature?	
What liquid is in the vessel, and its concentration if a chemical?	
Is the liquid clean and clear, or dirty/viscous/carrying solids, or does it need interface tracking?	
What body/wetted material is required?	
What connection is available on the vessel?	
What vent and drain configuration is needed — plug or valve, and what size?	
For magnetic-bypass models: what flag colour, and is a switch needed (how many, which housing)?	
Any special option needed — illumination, anti-frost, jacketing, multiple stacked sections?	
What industry is this for (e.g. oil & gas, power generation, food & beverage, water treatment, chemical/petrochemical)?	
What is the specific application or equipment (e.g. boiler feed line, compressor discharge, storage tank, filter skid)?
